

SSH Keys

- To login to a remote server like Perun or Graham, you would typically open your terminal and type

```
$ ssh -XY <user>@<HostName>
```

And then proceed to type in your password
Altogether A LOT of keystrokes

- It is however much much more convenient and safer to switch from a password authentication system to an **SSH Key based authentication system**

ACCOUNT CREATION

PASSWORD AUTHENTICATION

PASSWORD AUTHENTICATION

LET'S SEE ..

ARMISURPLUS = SIGNUM

VITRIOLIX = DIGNUSEST

GIVUSABONUS = SESTERTIUS

ASTERISCUS = AVECAESAR

GLUTEUSMAXIMUS = OLYMPUS

**PASSWORD
AUTHENTICATION
PASSED**

THESE ROMANS
ARE CRAZY

YOU MAY
ENTER

A HACKER LISTENING IN

AHA!
ACC: ASTERISCLUS
PWD: AVECAESAR

I AM
ASTERISCLUS

PASSWORD IS
'AVE CAESAR'

WHO ARE
YOU?

WHAT'S THE
PASSWORD?

SSH KEY AUTHENTICATION

A **public private**
key pair

A **public key** *encrypts* data

A public key can be freely distributed to anyone

A **private key** *decrypts* data

It can only decrypt data that was encrypted with
the associated public key

A private key must NEVER be shared with anyone!

SSH KEY KEY PAIR CREATION AND PUBLIC KEY TRANSFER

Create
key pair

Copy **public key**
and transfer

Authenticate
with your
password

SSH KEY AUTHENTICATION

ASTERISCLUS' PRIVATE KEY

ASTERISCLUS' PUBLIC KEY

I AM
ASTERISCLUS

YES,
OF COURSE!

WHO ARE
YOU?

CAN YOU
DECRYPT
THIS RANDOM
ENCRYPTED
NUMBER?

SSH KEY AUTHENTICATION

I AM
ASTERISCLUS

YES,
OF COURSE!

WHO ARE
YOU?

CAN YOU
DECRYPT
THIS RANDOM
ENCRYPTED
NUMBER?

AHA!

KEY ID:
ASTERISCLUS

ENCR #:
76103L7X987CJ
2457CBJNDVMC
DFG87KJV82

SSH KEY
AUTHENTICATION
PASSED

THESE ROMANS
ARE *NUTS!!*

YOU MAY
ENTER

- **No more password** required
- **Safer** because an external listener will
 - (a) have an EXTREMELY hard time to decrypt the number without the private key
 - (b) the number used is different each time you log in
- **RISK:** if an attacker gains access to your system in any way, they can enter any remote that you have an SSH Key set up for without having to enter a password

You can offset that risk by **setting a passphrase**, but this means you have to type the passphrase each time you login. Setting a passphrase encrypts your private key file

- The SSH Key + passphrase combination is the safest option, by far

When connecting to computer clusters, you should probably set up an SSH Key + passphrase authentication !!!

CREATING SSH KEY PAIRS

1. `$ ssh-keygen -t rsa`
2. Save private key as `~/.ssh/<id>_rsa`
Public key auto saved as
`~/.ssh/<id>_rsa.pub`
3. Optionally choose a passphrase
4. `$ ssh-copy-id -i ~/.ssh/<id>_rsa.pub <user>@<HostName>`
5. Enter regular password
6. The public key is now stored in `~/.ssh/authorized_keys` server side

You can now login without typing the password with

```
$ ssh -i ~/.ssh/<id>_rsa <user>@<HostName>
```

ADDING A PASSPHRASE TO A PRE-EXISTING SSH KEY PAIR

```
$ ssh -p -f ~/.ssh/<id>_rsa
```

CHOOSING A PASSWORD OR PASSPHRASE

- **RULE #1**

Do NOT use 'password', '1234', 'qwerty', 'letmein' or something like that

- **RULE #2**

Do NOT use a password < 8 characters, a hacker can *bruteforce* it!!

- **RULE #3**

Do NOT use common words, a hacker can *dictionary-attack* it!!
That includes replacing A with 4, E with 3, 0 with O, etc etc

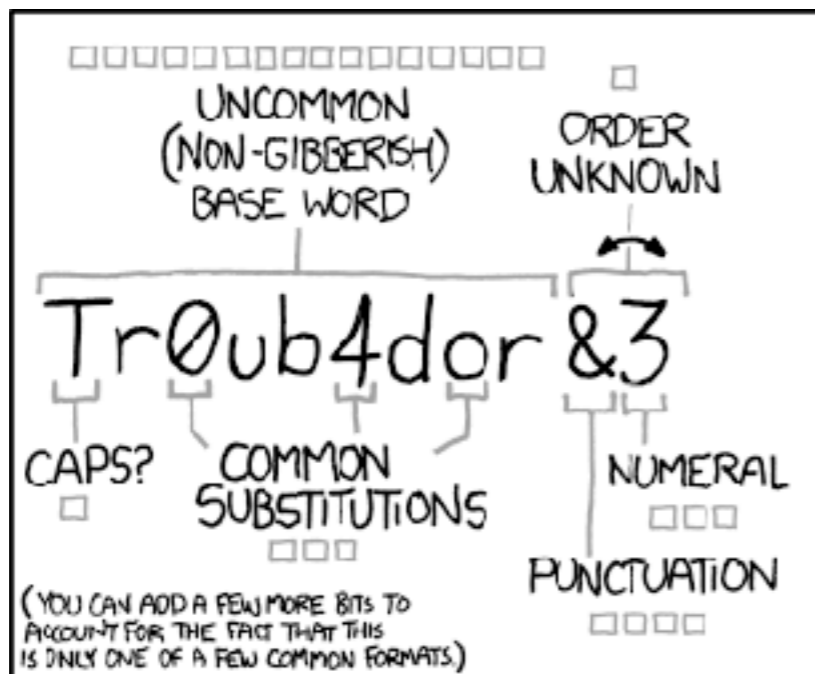

See

<https://www.youtube.com/watch?v=3NjQ9b3pplg>

<https://www.youtube.com/watch?v=7U-RbOKanYs&t=1s>

- **RULE #4**

NEVER use the same password twice

~28 BITS OF ENTROPY

$2^{28} = 3 \text{ DAYS AT } 1000 \text{ GUESSES/SEC}$

(PLAUSIBLE ATTACK ON A WEAK REMOTE WEB SERVICE. YES, CRACKING A STOLEN HASH IS FASTER, BUT IT'S NOT WHAT THE AVERAGE USER SHOULD WORRY ABOUT.)

DIFFICULTY TO GUESS: **EASY**

WAS IT TROMBONE? NO, TROUBADOR. AND ONE OF THE 0s WAS A ZERO?

AND THERE WAS SOME SYMBOL...

DIFFICULTY TO REMEMBER: **HARD**

~44 BITS OF ENTROPY

$2^{44} = 530 \text{ YEARS AT } 1000 \text{ GUESSES/SEC}$

DIFFICULTY TO GUESS: **HARD**

THAT'S A BATTERY STAPLE.

CORRECT!

DIFFICULTY TO REMEMBER: YOU'VE ALREADY MEMORIZED IT

THROUGH 20 YEARS OF EFFORT, WE'VE SUCCESSFULLY TRAINED EVERYONE TO USE PASSWORDS THAT ARE HARD FOR HUMANS TO REMEMBER, BUT EASY FOR COMPUTERS TO GUESS.

- **TIP #1**

Use long nonsense but pronounceable words or words from some strange language

nonsense word generator

<https://www.soybomb.com/tricks/words/>

Fairly easy to remember and easy to type

- **TIP #2**

Place a symbol in a place that doesn't make sense

correct_horse_battery_staple 
corre_cthor_sebatte_rysta_ple 

- **TIP #3**

Store your passwords in a password manager or a little physical notebook

SSH Config

- `~/.ssh/config`
- If it doesn't exist yet, you can create it

```
$ touch ~/.ssh/config
```

- A configuration file that remembers for you which ssh parameters you want to run when you want to connect to a particular server
- `$ ssh -i ~/.ssh/<id>_rsa -XY <user>@<HostName>`

equals

```
$ ssh <hostAlias>
```

when in your `~/.ssh/config` you have :

- Saves you a TON of keystrokes!!
- Also add to your `~/.bashrc` :

```
Host <hostAlias>
  HostName <HostName>
  User <user>
  IdentityFile ~/.ssh/id_rsa
  ForwardX11 yes
  ForwardX11Trusted yes
```

```
# add tab completion for remote hosts in ssh config file
complete -o default -o nospace -W "$(grep '^Host' ~/.ssh/config | cut -d' ' -f2)" ssh
```

BONUS

**MAN
PAGES**

**TLDR
PAGES**

```
$ apt install tldr # Ubuntu  
$ brew install tldr # MacOS
```
